Slim Line Memory: A new design for the CompactFlash interface, the Slim Line Memory (SLM) standard, allows for SD and CompactFlash cards to be directly inserted into a computer's USB port. Slim Line Memory (SLM) also works with slots compatible with CompactFlash. The SLM cards are only available for USB 2.0 and USB 3.0. Flash Drive The USB Flash Drive feature allows users to remove the CompactFlash Card for use as a USB mass storage device. The CompactFlash Toolbox allows a CompactFlash to be reformatted as a standard USB Flash Drive without the need to remove it from the card. Input/Output Input/Output allows the CompactFlash Card to be used as a standard USB drive or for an audio system. SATA SATA CompactFlash Card readers were included with all versions of Windows Vista since they were released and the first generation of printers that support CompactFlash cards. Windows 7 and later Windows 7 and later release includes a native

support for the CompactFlash Card that can be used as either a standard CompactFlash reader or as a storage device.

References External links Category:Flash storageStructural and biochemical characterization of a recombinant plasmid for the expression of a human cDNA library in Escherichia coli. The unique sequence of cDNA inserts from human cDNA libraries generally precludes cloning into a commercial expression vector due to the presence of vector DNA sequences that interfere with normal expression of the cDNA product. We have constructed a plasmid, pPC61, that can be used to construct a cDNA library, and that is compatible with a wide range of commercially available expression vectors. The human origin of cDNA inserts in the library makes it useful for studying human tissue specific gene expression, and analysis of protein interaction with human peptides and proteins. pPC61 is a pBR322-based plasmid that can be used to express a cDNA library in a variety of expression vectors. It contains unique sequences to ensure that only cloned cDNA inserts are expressed. It contains multiple cloning sites for insertion of a cDNA library, and unique cloning sites for subcloning cDNA inserts into commercially available expression vectors. It can be transformed into both E. coli and competent cells that contain the general transcriptional machinery, and it can be propagated in 82157476af
